Coronavirus Apps From Around the World, Translated

Connie Chan, Avery Segal, Anne Lee Skates
March 31, 2020

We translated coronavirus-specific parts of apps created by tech companies, startups and governments worldwide.

In this moment of crisis, we are all navigating a world of uncertainty. With daily news of horrific human (health) and economic costs, it is natural to feel helpless and paralyzed in fear.

We are sharing translated screenshots of COVID-19 app features in the hope of inspiring tech companies to innovate for this time of crisis: to find new ways to use their platform and reach in the fight against the virus.

The following slides cover a range of examples, from WeChat and its integration of Tencent Health to an app used to distribute face masks to the general public. This isn't a comprehensive list, but more of a starting point for all of us to think about how we can use our skills and knowledge of the digital world to fight this virus together, and win.

(We prioritized speed over design. Stay safe, wash your hands, and wear a mask if you go outside)

WeChat & Tencent Health

Tracking symptoms

As students return to schools, WeChat has created functionality to help parents and teachers track early symptoms in students.

Tencent Health

This health portal, accessible via the Wallet in WeChat, has various information on COVID-19, including ways to look up nearby positive cases, the ability to search if you sat near someone who tested positive on a plane or a train, information on the correct way to wear a mask, and more.

WeChat Mini Program: Resume School Code (复学码)

Helps schools track each student's health and avoid transmission

The aim of this feature, according to Tencent: "when schools reopen, no matter whether it's primary schools, middle schools or universities, they can put up a school access barcode at the gate and let parents and outsiders scan via WeChat to enter school without hassle... (and) further manage people who enter schools"

WORLDWIDE DATA - Country stats to track global spread

Alipay, Tencent, & QR Tracking

Tracking cases

Developed and implemented within weeks, this Alipay color-coded QR system (at right) helps track where potential infected people have traveled, and can be accessed through both Alipay and WeChat:

1. Users fill in a form on Alipay with personal details and the software generates a QR code in one of three colors.
2. QR code checks are required to get on trains and subways, as well as some cafes, shopping malls, and restaurants
3. Yellow/red status may be given to someone who has had contact with an infected person, visited a virus hot zone, or reported having symptoms in the sign-up form.

Tencent recently rolled out a similar system within WeChat, specifically targeting back-to-school use cases for students returning to school and outsiders visiting schools

Food delivery with the Ele.me app

The app shows users the body temperature of the courier

Mask distribution via app

Masks for protection

In Taiwan, people are able to receive three masks per person every week. To pick up their masks, users can download an app that locates the closest distribution store and shows how many adult size and kid-size masks are left in real time.

In addition, in Taipei*, quarantined people receive a daily text message:

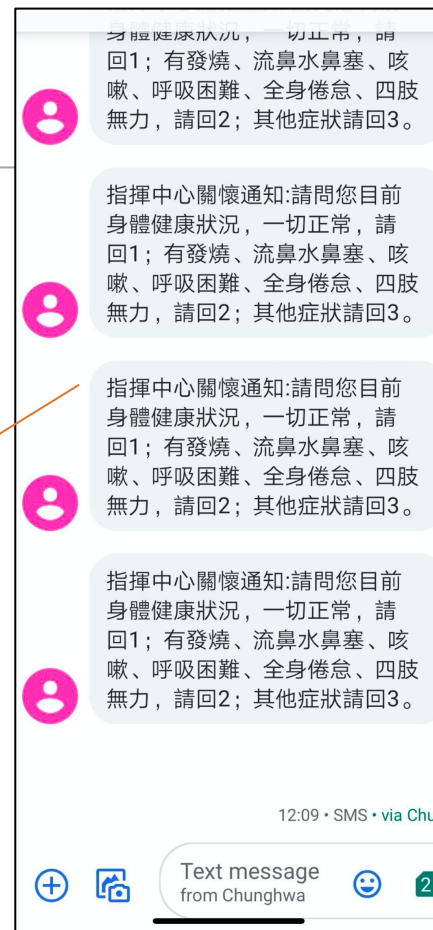

Users can choose from the following responses:

1 if everything is OK,

2 if fever, runny nose, stuffy nose, cough, difficulty breathing, or general body weakness.

3 if other symptoms

**Similar case in South Korea*

Timely Mask Map app (及时口罩地图), Taiwan

Mainstream apps add dedicated COVID-19 sections

Dedicated sections in apps

From Weibo (“China’s Twitter”) to podcasting apps, many mainstream apps in China have now created new sections dedicated to COVID-19. The features range from accepting donations to supporting farmers by buying produce directly to online medical advice. For instance, on Baidu more than 100k doctors in China have responded to over 38 million inquiries about the virus.

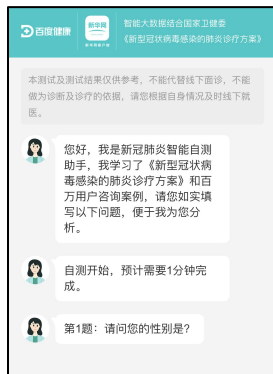

What’s interesting to note is that these apps aren’t all news-related, but have used their distribution power to deliver content that they deem helpful, in addition to launching COVID-19-specific features.

Baidu's dedicated COVID channel includes a Q&A community with doctors, AI-powered chatbots and callbots and more

Free, online Q&A community with more than 100k doctors fielding 38M+ inquiries

Free, AI-powered chatbot with coronavirus information and news. A callbot makes automated calls to people checking travel status, health condition, etc.

In-app, live temperature monitoring via computer vision; thermal imaging of fellow transit passengers; and live notifications of potential COVID-19-positive people near you

Baidu maps with real-time road closures and heatmap of high-density areas, confirmed case locations, and locations of hospitals and clinics

TraceTogether (Singapore) and HaMagen “The Shield” (Israel) track contact with anonymous positive COVID-19 people and spaces

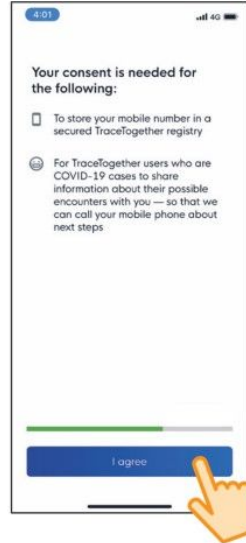

1 Users here can download the app on the Apple App Store or the Google Play Store.

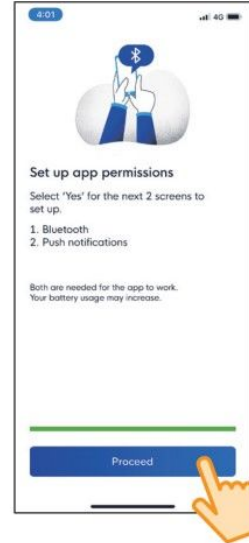

2 Users have to input their mobile phone number for MOH to be able to contact them quickly. The number is the only data collected by the Government through the app.

3 During the initial set-up, users have to give their explicit consent to be able to use the app.

4 Users will then have to enable push notifications and location permissions, and keep the Bluetooth function on their phones turned on.

5 This is because the app uses short-distance Bluetooth signals that are exchanged between phones to detect other TraceTogether users in close proximity.

6 • Official contact tracers who call users will provide a code that users can match with a corresponding verification code on their app.

- Once authenticated, users will be given a PIN number that allows submission of logs when entered.
- Official contact tracers will not ask for personal financial details or transfer of money.

Sources: GOVTECH, MINISTRY OF HEALTH PHOTOS: GOVTECH STRAITS TIMES GRAPHICS

TraceTogether (shown above) uses open-sourced Bluetooth tech to detect contact with COVID-infected people; those who do come in contact receive notifications for testing. Similarly, Israel's HaMagen app ([GitHub](#)) takes location data from the user's phone and compares it with information in the Health Ministry servers to identify possible contact.
